- B – Shaft packing
- C – Bellows assembly
- D – Insert/primary ring

Type 680

Type 670/676

Sealol® Welded Metal Bellows

Product Description

Type 670: All-alloy C-276 high-strength low-temperature bellows assembly for highly corrosive applications.

Type 676: AM350 low-temperature bellows assembly for large sizes and mildly corrosive applications.

Type 680: All-alloy 20 low-temperature high-performance seal for use on a broad range of corrosive media.

Performance Capabilities

- Temperature: -75°C to +290°C/-100°F to +550°F
(Depending on materials used)
- Pressure: Vacuum to 25 barg/360 psig
(See basic pressure ratings curve)
- Speed: U-p to 25mps / 5,000 fpm

Design Features

- Edge-welded metal bellows
- Static secondary seal
- Standard components
- Available in single or dual arrangements, shaft-mounted or in a cartridge
- The Type 670 meets API 682 requirements

Typical Applications

- Acids
- Aqueous solutions
- Caustics
- Chemicals
- Food products
- Hydrocarbons
- Lubricating fluids
- Slurries
- Solvents
- Thermo-sensitive fluids
- Viscous fluids and polymers
- Water

TYPE 670/676/680

LOW-TEMPERATURE METAL BELLOWS SEALS

Typical 670 with a Secondary Containment Seal Arrangement

Typical 676 Dual Cartridge Arrangement

Typical 680 Single Shaft-Mounted Arrangement

Type 680

Basic Pressure Rating

The basic pressure rating is for a standard seal, as shown in the typical arrangement, when installed according to the criteria given in this data sheet and generally accepted industrial practices.

The basic pressure rating assumes stable operation at 3,600 rpm in a clean, cool, lubricating, non-volatile liquid with an adequate flush rate. When used with the multiplier factors, the basic pressure rating can be adjusted to provide a conservative estimate of the dynamic pressure rating.

Contact John Crane for process services outside this range or a more specific assessment of the dynamic pressure rating.

NOTES:

1. Basic Pressure Rating Curve based on Single-Ply Bellows.
2. Basic Pressure Rating Curve is differential pressure applied to seal outside diameter.
3. Inside Diameter Differential Pressure vs. Temperature Limits: If the inside diameter differential pressure is greater than 6 barg/90 psig or the operating temperature is greater than 165°C/325°F, or seal size is greater than 100mm/4", consult John Crane Engineering.

Multiplier Factors

	Selection Consideration	Multiplier Factors	
		Carbon vs. SiC	SiC vs. SiC
Speed	Up to 3,600 rpm	x 1.00	x 1.00
	Above 3,600 rpm	x (3,600/speed)	x (3,600/speed)
Sealed Fluid Lubricity	Petroleum/gasoline, kerosene, lube oil, etc.	x 1.00	x 1.00
	Water and aqueous solutions (< 80°C/176°F)	x 0.75	x 0.75
	Light hydrocarbons (see Note 1)	x 0.60	(see Note 2)
Sealed Fluid Temperature (see Note 3)	Up to 80°C/176°F	x 1.00	x 1.00
	Up to 120°C/250°F	x 0.85	x 1.00
	Up to 205°C/400°F	x 0.70	x 1.00

Example for determining pressure rating limits:

Seal: Type 680
 Size: 50 mm/2"
 Product: 50/50 glycol and water
 Face material: carbon vs. silicon carbide
 Operating temperature: 95°C/200°F
 Operating speed: 3,600 rpm

Example for determining dynamic pressure rating:

The maximum pressure for a particular application is the lesser of the maximum pressure limit curve or the pressure calculated when the multiplier factors are applied to the specific seal face material curve.

Maximum pressure limit curve:

21 bar (g)/300 psi (g) max pressure
 Carbon limit curve: 32 bar (g)/460 psi (g)
 Calculated limit: 32 bar (g)/460 psi (g) x 1.00 x 0.75 x 0.85 = 20.2 bar (g)/293 psi (g)
 At 3,600 rpm with the service conditions noted, a 50 mm/2.000" (seal size) Type 680 has a maximum operating pressure limit of 20.2 bar (g)/293 psi (g).

NOTES:

1. Specific gravity > 0.6 and ratio of sealed pressure to vapor pressure > 1.5.
2. More details regarding the fluid and the operating conditions are required.
3. Temperature at the seal faces includes effects of flush. Temperatures must not exceed limits shown in max. temperature limits section.
4. Contact John Crane for more information.

Maximum temperature limits:

Type 670: Carbon insert: 290°C/550°F
 Tungsten carbide or silicon carbide: 200°C/400°F
 Type 676: Carbon insert: 200°C/400°F
 Tungsten carbide or silicon carbide: 190°C/375°F
 Type 680: Carbon insert: 260°C/500°F
 Tungsten carbide or silicon carbide: 150°C/300°F

Materials of Construction

Description	Seal Components	Seal Types	Materials	
			Standard	Options
Bellows	Type 670	Alloy C-276 (UNS N10276)	—	
	Type 676	AM350 SS (UNS S35000)		
	Type 680	Alloy 20 (UNS N08020)		
End-fittings	Type 670	Alloy C-276	—	
	Type 676	316L SS (UNS S31603)		
	Type 680	Alloy 20		
Insert/primary ring		Premium carbon grade tungsten carbide, silicon carbide	—	
Static seals		Fluorocarbon, EPR, PTFE-encapsulated fluorocarbon, nitrile, perfluoroelastomer	—	

Recommendations for Viscous Fluids

0 - 1,000 cSt: Standard seal

1,000 - 3,500 cSt: Hard face material

3,500 - 10,500 cSt: Consult John Crane Engineering

NOTE: SSU (Saybolt Universal Seconds) approximately equals cSt (centistoke) $\times 4.6347$ cP (centipoise) = cSt (centistoke) \times specific gravity.

Welded Metal Bellows

Bellows design features

- Optimum 45° tilt angle
- Three-sweep radius
- Nesting ripple plate design
- Static secondary seal
- Light spring loads

Bellows benefits

- Uniform plate rigidity and stress distribution
- Enhanced fatigue strength
- Pressure-balanced by design
- Less heat generated
- Lower power consumption
